

Saccharides

sugars

classification

according number of sugar units

- monosaccharides
- oligosaccharides (2-10 monosaccharides)
- polysaccharides (> 10 monosaccharides)
- conjugated (complex) saccharides eg. glycoproteins

free

bound homoglycosides, heteroglycosides, aglycons (non-sugar components)

Monosaccharides

polyhydroxyalkyl substituted aldehydes and ketones
and derived compounds

main nutrients

biologically and sensory active compounds

structure and classification

according to type of carbonyl group

- aldoses
- ketoses

according to number of C atoms (3-8)

◆ trioses

D-(+)-glyceraldehyde (D-glycero-triose)

L-(-)-glyceraldehyde

optical isomers (enantiomers)

D/L, R/S

d/l, +/-

equimolar mixture of D + L = racemate (opt. inactive)

1,3-dihydroxyacetone (1,3-dihydroxypropan-2-one, glycerone)

◆ tetroses (erythrose, threose, erythrulose)

epimers - aldoses differing only by configuration at C2

- ◆ pentoses (ribose, arabinose, xylose, lyxose, ribulose, xylulose)
- ◆ hexoses

D-glucose (D-*gluko*-hexose)

dextrose, grape sugar

D-fructose (D-*arabino*-hex-2-ulose)

levulose, fruit sugar

according to chain

- ◆ linear chain
- ◆ branched chain

D-ribose (carrot, parsley)

according to type of cyclic structure (lactol)

spontaneous by intramolecular addition

stable hemiacetals (energetically preferable)

- ◆ furanoses
- ◆ pyranoses
- ◆ septanoses

α -D-glukopyranosa

β -D-glukopyranosa

α -D-glukofuranosa

β -D-glukofuranosa

α -D-fruktopyanosa

β -D-fruktopyanosa

α -D-fruktofuranosa

β -D-fruktofuranosa

mutarotation

anomers - anomeric C, anomeric OH

| saccharide (40 °C) | % furanose | | % pyranose | |
|--------------------|------------|---------|------------|---------|
| | α | β | α | β |
| D-glucose | < 1 | < 1 | 36 | 64 |
| D-fructose | < 1 | 25 | 8 | 67 |

$\cong 0,02\%$ acyclic form

Anomer α - the configuration of hydroxyl group agree with the one at chiral C atom with the highest number in the circle

conformation

- ◆ furanoses (furanoses (envelope E , twist T))
- ◆ pyranoses (chair 4C_1 , 1C_4)

acyclic form

occurrence

components of almost all foodstuffs

intake from food in %

| food | saccharide | % |
|---------------------|-------------------------|----------|
| cereals | starch | 48 |
| saccharose | saccharose | 22 |
| vegetables | starch, monosaccharides | 13 |
| fruits | monosaccharides | 5 |
| milk, milk products | lactose | 7 |

| food | saccharide | content in % |
|-------------|---|---------------------|
| meat | glucose, fructose, ribose (phosphates) | 0.05-0.20 |
| | glycogen | 1-2 |
| milk (cow) | lactose | 4-5 |
| | higher galactooligosaccharides | traces |
| eggs | glucose | 0.9-1.0 |
| cereals | polysaccharides (starch) | 59-72 |
| | glucose | 0.01-0.10 |
| | fructose | 0.02-0.1 |

carminic acid
(anthraquinones)

Cochineal, Carmine, Carminic acid (E120)

The **cochineal** [/kɒtʃɪˈniːl/](#)
- scale insect

Carmine is the name of the colour pigment obtained from the insect *Dactylopius coccus* (old name *Coccus cacti*), that lives on cacti from the genus *Opuntia*. The insect is native to tropical South and Central America and produces the pigment as a deterrent against other insects. The pigment can be obtained from the body and eggs of the insect.

Cochineal was already used as a colour by the Aztec and Maya peoples of Central and North America . Cochineal was a commodity of much value, even comparable to gold.

Cities send bags of cochineal to the capital Tenochtitlán as a yearly contribute to the emperor. The Spanish conquerors of Central America saw the value of the dye, which produced a much better colour than the dyes used in Europe at the time. The dye, which at the time was mainly used in cosmetics and textiles and to a lesser extend in foods, became very popular in Europe. Roman Catholic Cardinals robes were coloured with cochineal, as were the jackets of the British military.

Cochineal, Carmine, Carminic acid (E120)

- is one of the few natural and water-soluble colorants that resist degradation with time. It is the most light- and heat-stable and oxidation-resistant of all the natural colorants and is even more stable than some synthetic food colours.

Production

The insects are killed by immersion in hot water (after which they are dried) or by exposure to sunlight, steam, or the heat of an oven. Each method produces a different colour which results in the varied appearance of commercial cochineal. The insects must be dried to about 30 percent of their original body weight before they can be stored without decaying. It takes about 155,000 insects to make one kilogram of cochineal.

There are two principal forms of cochineal dye: cochineal extract (E120(ii)) is a colouring made from the raw dried and pulverised bodies of insects with around 20% carminic acid; and carmine (E120(i)) a more purified colouring made from cochineal.

Cochineal Red

This is the name of an azo dye, E124, which bears no resemblance with cochineal, but produces a similar colour, hence the (confusing) name

Oligosaccharides

homoglycosides

pentoses, hexoses, sugar acids and other derivatives

furanoses, pyranoses

classification

according to number of monosaccharides (2-10)

disaccharides (bioses) – decasaccharides (decaoses)

according to semiacetal OH

reducing (glycosides)

non-reducing (glycosylglycosides)

according to major monosaccharids (backbone)

- ◆ glucooligosaccharides

maltose, maltooligosaccharides

- ◆ fructooligosaccharides

saccharose (sucrose)

- ◆ galactooligosaccharides

lactose, α -galactosides

according to digestability

digestible

non-digestible

according to biological effects

prebiotic - stimulate the growth and/or activity of bacteria in the digestive system in ways claimed to be beneficial to health (eg. fructooligosaccharides)

probiotics - live microorganisms that may confer a health benefit on the host

synbiotic (simultaneously prebiotic and probiotic effects)

Products of condensation

α -D-Glcp and β -D-Glcp

glucooligosaccharides

maltose

malt sugar

occurrence

product of starch hydrolysis, reversion of glucose
malt, bread (1.7-4.3%), honey (3-16%)

production

- ◆ **maltose (85%) and glucose sirups** (acids, enzymes)
- ◆ **maltose**
- ◆ isomeration on **maltulose**
- ◆ reduction on **maltitol**

fructooligosaccharides

saccharose (sucrose)

beet sugar

cane sugar

occurrence

fruits

up to 8%

vegetables

0.1-12%

15-20%

sugar cane

12-26%

maple sirup

5%

dates

81% (dried)

production (from sugar beet)

- ◆ extraction of sugar beet slices (diffusion)
- ◆ cleaning (epuration) of crude juice, clarification by $\text{Ca}(\text{OH})_2$
- ◆ saturation by CO_2
- ◆ filtration, light juice
- ◆ thickening
 - heavy juice (61-67% saccharose, 68-72% dry matter)
- ◆ crude (brown) sugar
 - 96 % saccharose, 2-3% non-sugars, 1-2% water
(1.0-1.2% organic, 0.8-1.0% inorganic matters)
- ◆ afinade
- ◆ rafinade

Molasses is a viscous by-product of the refining of sugarcane or sugar beets into sugar folder, substrat for fermentation processes

Rum - a distilled alcoholic beverage made from sugarcane byproducts such as molasses, or directly from sugarcane juice, by a process of fermentation and distillation

galactooligosaccharides

lactose

milk sugar

occurrence

cow's milk

4-5%

human milk

5.5-7%

production (from whey)

- ◆ **ultrafiltration**
- ◆ **thickening, crystallisation**

production of galactose, galactitol, lactulose, lactitol

α -galactooligosaccharides of legumes

chickpea

| legumes | saccharose | raffinose | stachyose | verbaskose |
|-------------|------------|-----------|-----------|------------|
| green beans | 2.2-4.9 | 0.3-1.1 | 3.5-5.6 | 0.1-0.3 |

content of polysaccharides in wheat flour

| polymer | content in % |
|-----------------------------------|---------------------|
| starch | 59-72 |
| non-starch polysaccharides | 3-11 |
| cellulose | 0.2-3 |
| hemicellulose | 2-7 |
| arabinoxylans | 1-3 |
| β -glucans | 0.5-2 |
| xyloglucans | 0.2-0.4 |
| pectins | 0.3-0.5 |
| glucofructans (fructans) | 1-4 |

starch

structure

mixture of 2 glycans: amylose and amylopectin

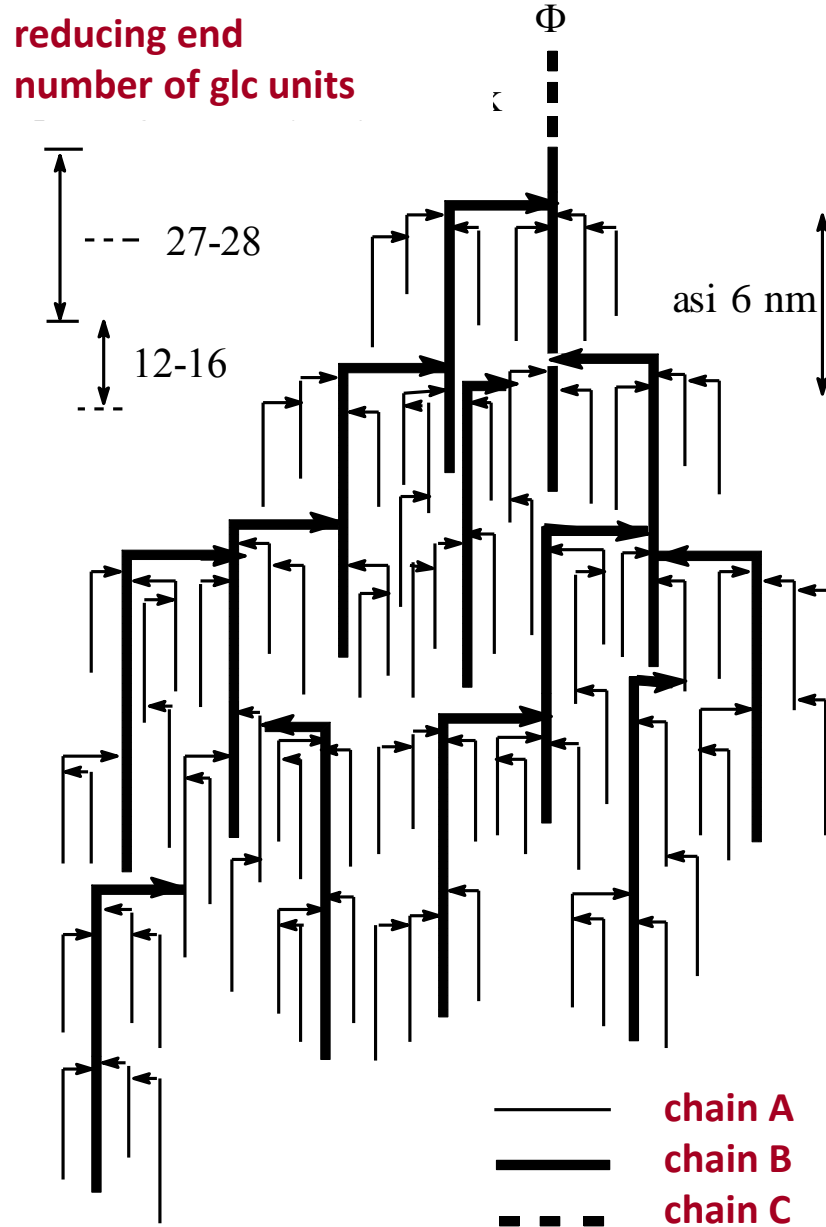

| složka | units | disaccharide | bond | solubility in cold water | behavior by heating |
|-------------|----------------|-----------------------|------------------------------------|--------------------------|------------------------------------|
| amylose | $\approx 10^3$ | maltose | α -(1→4) | ano | low viscosity |
| amylopectin | $\approx 10^6$ | maltose isomaltose | α -(1→4) α -(1→6) | ne | very viscous, by cooling gives gel |

amylopectin

schematic
structure of
amylopectin

sources

- ◆ cereals
- ◆ potatoes
- ◆ legumes

other – amaranth, Jerusalem artichoke, cassava, sago

| food | % starch | % amylose |
|----------|----------|-----------|
| wheat | 59-72 | 24-29 |
| potatoes | 17-24 | 20-23 |
| beans | 46-54 | 24-33 |
| cassava | 28-35 | 17-19 |

amylocultivars (eg. barley: 60-70% amylose)

waxcultivars (barley: 2-8% amylose)

fruits: bananas (only 1% in mature)

seeds: chestnuts, cashews

starch granules in plastides (chloroplasts, amyloplasts)

double helix of side chains of amylopectin

other components of starch granules

- ◆ lipids (in wheat 0.4-0.7%, mostly lysophospholipids)
- ◆ proteins (in wheat friabiline, 0.3%)

behaviour in water during heating

- ◆ granules - water content 13% (wheat), 18-22% (potato)
- ◆ insoluble in cold water - **suspension**
- ◆ increase to 30% without changes of shape and size (**imbibition**)
- ◆ during heating to **gelatination temperature** 50-70 °C (52-64 °C wheaten, 50-68 °C potato)

swelling (disconnection of H-bonds)

hydrated chains move away, **amylose** is released into solution

starch sol - viscous

- ◆ increasing viscosity during cooling,
new bindings amylose / amylopectin - new 3D grid - **starch gel**
- ◆ ageing of gel - **retrogradation** (syneresis) – release of water out of 3D grid
re-gelatination (association of amylose)

behaviour during bread production

- ◆ mechanical damage of granules during grinding (5-10%)
- ◆ enzymatic hydrolysis during fermentation by **amylases (diastase)**

amylose

α -amylase (dextrinogenic) – randomly attacks **α -(1→4) bonds**
→ Glc, maltose, dextrans

β -amylase (saccharogenic) → **cleaves off maltose**

amylopectin

α -amylase and **β -amylase** → limit **β -dextrans**

pullulanasa, isoamylasa

- ◆ gelation of the starch (the effect of water content, fats, emulsifiers)
- ◆ **pyrodextrans** - dextrans produced by heat
 α -(1→6), ether bonds (6→6)
- ◆ **resistant starch**

application

- ◆ modified starches (eg. starch esters, ethers, crosslinked phosphates)
- ◆ dextrans $DE \leq 20$ - non-sweet viscous solutions - prevent the formation of crystals (ice cream)
 - flavour carriers
- ◆ starch syrups
 - type I (DE = 20-38), type II (DE = 38-58), type III (DE = 58-73)
 - (maltose syrups typ II, typ III)
- ◆ glucose syrups typ IV (DE > 73)
- ◆ fructose syrups (glucosaisomerase, *B. circulans*, 55% Fru)

DE (dextrose equivalent) = content of free glucose in %

starch - DE = 0

glucose - DE = 100

fructosans

fructans, glucofructans (terminal unit is glc)

fructooligosaccharides have a prebiotic effect, meaning they are used by beneficial bacteria that enhance colon health and aid digestion

structure

- ◆ inulins β -(1 \rightarrow 2) chicory, Jerusalem artichokes, dahlias
- ◆ levans (fleins) β -(1 \rightarrow 6) beet juice, *Bacillus subtilis*
- ◆ with mixed bonds β -(1 \rightarrow 2), β -(1 \rightarrow 6) cereals, vegetables

sources

| food | glucofructans (%) | fructans (%) |
|----------------------------|-------------------|--------------|
| Jerusalem artichoke | 16-20 | 12-15 |
| Chicory (root) | 15-20 | 8-11 |
| garlic | 9-16 | 3.5-6.5 |
| wheat | 1-4 | 1-4 |

wild Chichory (*Cichorium intybus*)
(*Asteraceae*),

Cichory – cultivar
roasted roots – used as coffee surrogates

Jerusalem artichoke
(*Helianthus tuberosus*)

The **yacón** (*Smallanthus sonchifolius*) is a traditionally grown in the northern and central [Andes](#) from [Colombia](#) to northern [Argentina](#) for its crisp, sweet-tasting, [tuberous](#) roots. Their texture and flavour are very similar to [jicama](#), mainly differing in that yacón has some slightly sweet, resinous, and floral (similar to [violet](#)) undertones to its flavour, probably due to the presence of [inulin](#). Another name for yacón is **Peruvian ground apple**, possibly from the French name of potato, *pomme de terre* (ground apple). The tuber is composed mostly of water and [fructooligosaccharide](#).

cellulose
structure

$\cong 15\ 000$ molecules, β -(1 \rightarrow 4)

stabilisation by H-bonds, fibres (microfibriles)

sources

- ◆ cell walls of plant cells
- ◆ association with hemicelluloses, pectins

| | |
|--------------------|--------|
| fruits, vegetables | 1-2% |
| cereals, legumes | 2-4% |
| wheat flour | 0.2-3% |
| bran | 30-35% |

use

modified celluloses(hydrolysed, derivatized)

hemicelluloses

non-cellulose polysaccharides – fill the spaces between the cellulose fibers
part of the insoluble components of fiber

◆ heteroglucans

xyloglucans

fruits, vegetables, legumes

β -glucans

fruits, vegetables, cereals

$\text{R} = \text{COO}^-$ nebo COOCH_3

gums and plant mucilages

gels are not formed, high viscosity liquids

Mucilage is a thick, gluey substance produced by nearly all plants and some microorganisms. It is a polar glycoprotein and an exopolysaccharide. Mucilage in plants plays a role in the storage of water and food, seed germination, and thickening membranes. Cacti (and other succulents) and flax seeds especially are rich sources of mucilage

The following plants are known to contain far greater concentrations of mucilage than is typically found in most plants:

- [Aloe vera](#)
- [Basella alba](#) (Malabar spinach)
- [Cactus](#)
- [Chondrus crispus](#) (Irish moss)
- [Dioscorea opposita](#) (nagaimo, Chinese yam)
- [Drosera](#) (sundews)
- [Drosophyllum lusitanicum](#)
- [Fenugreek](#)
- [Flax](#) seeds
- [Kelp](#)
- [Liquorice](#) root
- [Marshmallow](#)
- [Mallow](#)
- [Mullein](#)
- [Okra](#)
- [Parthenium](#)
- [Pinguicula](#) (butterwort)
- [Psyllium](#) seed husks
- [Salvia hispanica](#) (chia) seed
- [Ulmus rubra](#) bark (slippery elm)

vegetable gums and mucilages

| gum (mucilage) | plant | |
|---------------------------|----------------------------|--------------------------------------|
| arabic (acacia) gum | <i>Acacia</i> sp. | exudate |
| Locust (carob) bean gum | <i>Ceratonia siliqua</i> | endosperm of the seed, legume |
| tragacanth gum (bassorin) | <i>Astragalus gummifer</i> | exudate |
| okra | <i>Hibiscus esculentus</i> | ovary |

microbial gums

| gum | microorganism |
|------------|-------------------------------|
| gellan | <i>Pseudomonas elodea</i> |
| xanthan | <i>Xanthomonas campestris</i> |

mucilage of okra **rhamnogalakturonan**

okra, lady's finger (*Hibiscus esculentus*)

Seaweed polysaccharides

building fuction

alginates

alginic acid, salts alginates (commercially- Na)

structure

β -D-mannuronic acid

α -L-guluronic acid

source

brown algae *Pheophyceae*

use

gelling agent, stabilizer

essential: presence of Ca^{2+} (like pectins)

modified alginates

agar- agar, carrageenans

structure

β -D-Galp 3,6-anhydro- α -L-Galp

agarobiose
agarose

β -D-Galp 3,6-anhydro- α -D-Galp

carabiose
carragenans

sources

red algae *Rhodophyceae*

application

thickeners, gelling agent

carrageenans (superhelixes) presence of neutralization ions

complexes with caseins

chitin

structure

β -D-glukosamin *N*-acetyl- β -D-glukosamin (chitosamin)

10-30 %

70-90 %

chitobiose

sources

- ◆ food: higher fungi (1%), yeasts (2.9%)
- ◆ industrially: sea shells

application

modified chitin = chitosan (75-95% glucosamine)

lignin

sources

lignified plant cells

- ◆ wood 25%
- ◆ bran 8%
- ◆ fruits, vegetables

structure

polymer of phenylpropane units

p-coumaryl alcohol, $R^1 = R^2 = H$

coniferyl alcohol, $R^1 = OCH_3$, $R^2 = H$

sinapyl alcohol, $R^1 = R^2 = OCH_3$

the basic structure of lignin
